

How can I create a new domain alias in Plesk Onyx?

- 2021-08-10 - Άλλες

Aliasing a domain allows multiple sites to refer to the same website. This way, your site opens with many different domains without any extra charges, as long as you have already registered them.

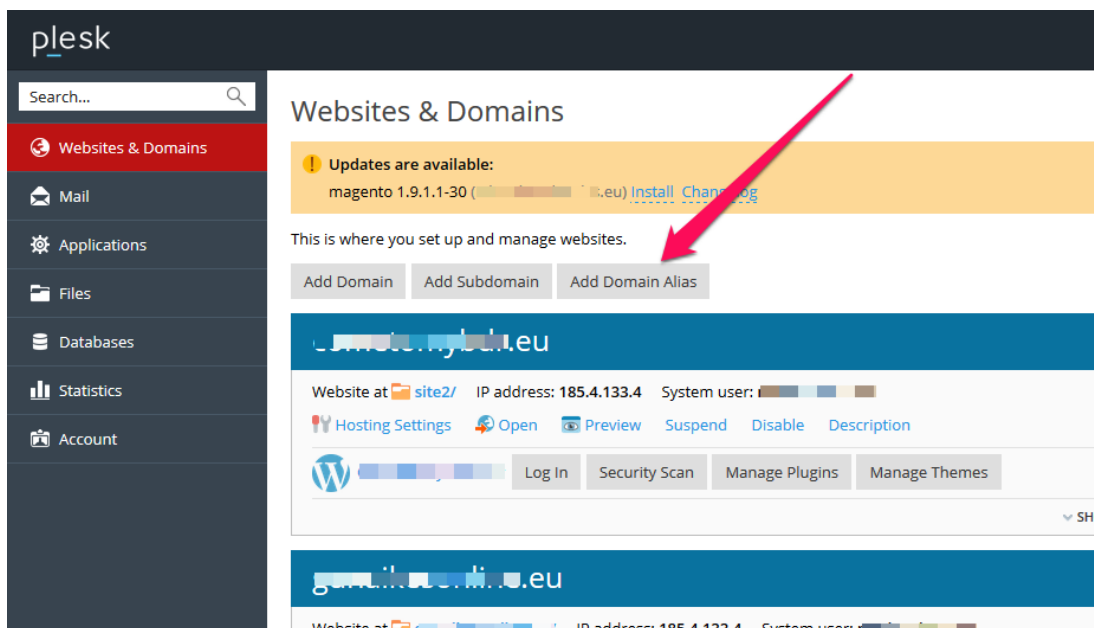

In order to create a domain alias in Plesk, take the following steps:

1. Log into [myTophost Panel](#) and select **Plesk Login** in order to connect to the Plesk of the plan that you are interested in.

2. In the tab **Websites & Domains**, click on **Add domain Alias**.

3. In the tab **Add a Domain Alias**,

- Enter the alias domain (1)

- Select the domain name for which you activated the alias (2)

Leave **default** in the following fields apart from **Redirect with the HTTP 301 code** which is optional as the search engines will automatically redirect to the main domain address once they find the alias address, resulting in its cancellation.

Synchronize DNS zone with the primary domain - to synchronize the DNS service.

Mail Service - When you receive an email on an account of the domain alias, you will receive it in the corresponding mailbox of the domain.

Web Service - in order to have all the domain Web services.

Redirect with the HTTP 301 code

Click on **OK**.

The screenshot shows the Plesk interface for adding a domain alias. The sidebar on the left contains navigation icons for Websites & Domains, Mail, Applications, Files, Databases, Statistics, and Account. The main panel is titled 'Add a Domain Alias' and includes the following elements:

- Domain alias name ***: A text input field containing 'www.newalias.gr' with a red '1' next to it.
- For example, domainalias.tld**: A text input field containing '.eu' with a red '2' next to it.
- Settings**: A section with several checkboxes:
 - Synchronize DNS zone with the primary domain
 - Mail service
 - Web service
 - Redirect with the HTTP 301 code
 - Java web applications

At the bottom of the form, there is a legend for '* Required fields' and two buttons: 'OK' and 'Cancel'.
